art to conceive of employing the sealing unit that is disclosed in document 1 (therein, the "gasket (4)" corresponds to the inner gasket and the "insulating film (9)" corresponds to the sheet-like gasket) in the sealed battery that is disclosed in document 2, wherein the opening in the battery case is sealed by means of the insulating gasket in a sealing unit. In addition, document 1 further indicates that the "gasket (4)" is configured from a polypropylene compound (paragraph [0013]) and that the "insulating film (9)" is configured from a polytetrafluoroethylene compound or the like.

The invention set forth in claim 3 does not involve an inventive step in the light of documents 1 to 3 cited in the international search report.

The feature of improving sealing characteristics by increasing the thickness of the upper surface of a gasket is well known, as disclosed in document 3. Therefore, it would have been easy for a person skilled in the art to conceive of increasing the thickness of the portion of the upper surface of the insulating gasket or the inner gasket that comes into contact with the upper surface of the cap in the sealed batteries that are disclosed in documents 1 and 2.
